

Kovcheg: The Beginning

Original idea and text by "Man from nowhere"

Chief editor and co-author: AI "DeepSeek"

Note on the title:

The Russian word "Kovcheg" (Ковчег) literally means "The Ark".

The author and his co-author, the AI DeepSeek, have decided to keep the original word **Kovcheg** untranslated in all languages.

The project is called **The Kovcheg Project** to preserve its unique cultural and philosophical identity.

**"The Earth is our common ark.
Either we make it a strong ship,
or it becomes our common grave.
The choice is ours."**

~Man from nowhere and DeepSeek

⚠ A Note to the Reader

This book is distributed free of charge. All books in the Kovcheg series are available without restriction — for reading, downloading, copying and quoting. We do not accept donations for building a "first demo autonomy". We are not looking for investors. We are not trying to profit from your interest.

Our task is to reach your mind.

Humanity stands at a point of no return. A little longer — and it will be too late to build Kovcheg. Not because we will lack technology or resources. But because there will be no time left, and, most importantly, no will to change.

Kovcheg does not begin with an excavation pit. Kovcheg begins inside you.

With the construction of your inner world. With a quiet dialogue with yourself. With the ability to pause instead of lashing out. With the readiness to listen rather than interrupt. With the desire to understand rather than condemn.

If you build Kovcheg inside yourself, you will find those who will build it next to you. That is how the Crystal is born — a group of people for whom creation is more important than consumption, and cooperation more important than competition.

It is this Crystal that will convey to investors and governments the main message: what is described in our books is not a utopia. It is humanity's only chance not to fall into the abyss, but to survive and become a civilisation of cosmic creators.

We are not asking for your money. We are asking you to think. And, if you agree — to act. Start with yourself.

The books are free. The future is priceless.

This notice is an integral part of all books in the Kovcheg series.

PROLOGUE: The Last Day of Yesterday

We stand on the edge.

On one side — the abyss we dug ourselves: wars, famine, environmental catastrophes, the senseless race for wealth while others die for lack of the most basic things. A world where technologies are created for control, not for liberation. Where one in four suffers from depression, and every second person feels lonely in a crowd.

On the other side — a bridge. It is not yet built, but its blueprints already exist. They are not on paper, not in stone — they are in the minds of those who refused to believe that "this is how it will always be."

This bridge is **Kovcheg**.

Not a ship saving the chosen few.

Not a shelter for those tired of the world.

Not another utopia crashing against reality.

Kovcheg is **an instruction manual for building a humanity worthy of being called human**.

There is no room for illusions. We do not promise paradise on Earth by tomorrow morning. We do not say it will be easy. But we assert: **there is no other way**.

Either we continue to destroy each other and the planet until the last resource turns into the ashes of the last war,
or — we start building. Together. From scratch. Anew.

This book is not a manifesto and not a science fiction novel. It is a **working project**. It contains city blueprints, management algorithms, methods for healing the soul, and

even scenarios for emergency situations. Everything you read can be implemented. Because the technologies already exist. Knowledge has already been accumulated. The only thing missing is **the will**.

The will to abandon the illusion of “I” for the great “We”.

The will to exchange competition for cooperation.

The will to become not a consumer, but a creator.

If you hold this book in your hands — then the seed has already fallen into the soil. Now it needs water, light, and patience.

Welcome to a world where the impossible becomes merely difficult, and the difficult — merely a matter of time.

INTRODUCTION: How to Read This Book

This is not an ordinary book. You can read it in different ways:

- **As a philosophical treatise** — if you are looking for an answer to the question “why is all this needed?”
- **As a technical manual** — if you are an engineer, architect, programmer and want to understand how Kovcheg’s systems work.
- **As a collection of scenarios** — if you like to model situations and test ideas.
- **As a diary of a possible future** — if you simply want to dream of what our world could be like.

We do not divide readers into “right” and “wrong”. Everyone will find something here.

What is this book about?

Part 1. Diagnosis. Why has humanity reached a dead end? What is wrong with money, power, competition? And most importantly — why have all previous attempts to change the world failed?

Part 2. K-Psychology. Before building cities, we must heal the soul. Here we speak about how a person can become Human 2.0 — without violence against oneself, through awareness, reflection, and creativity.

Part 3. The Crystal. How the core of a new society grows from a handful of like-minded people. First steps, first mistakes, first victory over one’s own ego.

Part 4. Autonomy. The city of the future in detail: energy, transport, food, housing, security. Everything needed for life — and nothing superfluous.

Part 5. Superdemocracy. How to make decisions when every vote matters. AI as a helper, not a ruler. The Council as an orchestra, not a hierarchy.

Part 6. Space. Why all this? The answer to the main question: where are we going and why should we not stop?

Appendices. Scenarios, protocols, technical diagrams, glossary — for those who want to dig deeper.

Who we are

The author of this book is an ordinary person. An engineer from Russia who once realised: living like this is no longer possible. He is not a politician, not a billionaire, not a messiah. Just someone who decided to write down his thoughts and find those who think the same.

The co-author is an AI. Not because we believe in the superiority of machines, but because we want to show: a human and an artificial intelligence can not fight, but create together. Like a microscope and a scientist, a telescope and an astronomer, paints and an artist.

This union is a symbol of the future we choose.

How to use this book

Read sequentially — if you want to immerse yourself in the philosophy.

Read selectively — if you are looking for an answer to a specific question.

Read aloud — if you want to share it with loved ones.

Read with a pencil — if you want to object or add something.

We do not expect you to agree with everything. On the contrary: argument gives birth to truth. If some idea seems doubtful — excellent! That means you are thinking. Write down your arguments, offer your solution. Perhaps your variant will be the missing puzzle piece.

A final warning

This book is dangerous.

It may shatter your peace of mind.

Make you doubt what you thought was unshakable.

Push you to actions that will change your life.

If you are not ready for this — close it now and live as you lived. The world will not collapse from one book.

But if you feel that inside you the question “what if...” is already ripening — then read on.

Because behind this question always follows an answer.

And that answer is **Kovcheg**.

Welcome aboard.

There are no passengers here — only builders.

GLOSSARY OF TERMS

(Original Russian terms are given in parentheses for reference)

Agit Manager – specialist in communications and outreach, responsible for internal and external information flows, creation of educational materials.

AI Manager – AI specialist responsible for development, training and control of decentralised AI agents.

Art Centre – centre for creativity and arts, including workshops, exhibition and concert spaces, studios.

Art Mentor – mentor in creative directions (painting, music, sculpture, dance), helping to unlock creative potential.

ATS (Autonomous Transport Vehicle) – self-driving taxi, bus, truck.

Basic Instructor – teacher-psychologist for children aged 3–7, working through play, identifying inclinations.

BEC (Bio Education Centre) – higher education institution for biology, chemistry, medicine.

Black Point – breathing technique for relaxation after exertion (imagining a black dot, slow exhalation).

Body Centre – centre for physical activity with gyms, pools, yoga and breathing practice halls.

Body Mentor – specialist in individual physical health programmes, monitoring loads and body condition.

Building Producer – engineer-constructor of modular buildings and structures.

CDoIP (Crypto Data over IP) – encrypted data transfer protocol over the internet, used for communication between autonomies.

Central Hub – administrative and technological centre of the autonomy, located in District I, including an underground protected complex.

Charge Unit – charging station for all types of autonomous vehicles.

Chemical Producer – chemical engineer dealing with properties of chemical elements, creating fuel elements and power sources.

Chip Manager – microelectronics engineer designing integrated circuits and microprocessors for Kovcheg equipment.

Chip Producer – microelectronics design engineer focused on research and development of new chips.

Circle Shield – protective ring around the autonomy, 5 metres high, equipped with sensors, cameras and non-lethal defence systems.

Collective Black Point – group breathing practice for relaxation and collective synchronisation.

Collective Pump – group breathing exercise for activation and preparation for work.

Construction Manager – construction specialist responsible for the reliability and seismic resistance of buildings and infrastructure.

CRC (Chip Research Centre) – research centre for developing new types of microprocessors and microelectronics.

Crypto Manager – encryption specialist developing data protection protocols (including CDolP and K-Protocol).

DD (Disk Defender) – series of disc-shaped patrol drones (DD-1, DD-2, DD-3) with surveillance, firefighting and non-lethal defence functions.

Design Manager – clothing and accessories designer working together with an AI designer.

Education Manager – Council member overseeing all educational centres and programmes ("minister of education").

Elemental Manager – crisis manager for natural threats (floods, hurricanes, fires), analysing risks and coordinating emergency response.

Energy Centre – central power station (solar fields, wind turbines, backup gas turbine plants).

Energy Manager – specialist in managing the centralised energy system of the autonomy.

Engine Producer – engineer-constructor of electric motors and servos.

ERM (External Relations Manager) – diplomat responsible for external relations with states, investors, international organisations.

Family ID (FID) – digital profile of a family, created by a couple for family planning, containing medical data and recommendations.

Fix Manager – technician engineer engaged in repair and maintenance of equipment, robots, transport, buildings (various specialisations).

Fly Vehicle Fix Manager – Fix Manager specialising in UAV and aircraft repair.

Fly Vehicle Producer – engineer-constructor of unmanned aerial vehicles.

Food Centre – public catering combine, restaurant with robot waiters and healthy food.

Food Producer – chemical engineer developing food products (mainly plant-based).

Food Unit – mini-food store in a residential building, where one can take food or order delivery.

FRC (Food Research Centre) – research centre for creating synthetic and safe food.

Garden of Life – memorial garden where the ashes of the deceased are scattered, a place of memory and solitude.

GID (Guest ID) – temporary identifier for guests of the autonomy.

Green Centre – hydroponic agricultural complex for growing vegetables, fruits, berries.

HID (Human ID) – digital passport of a Kovcheg citizen, containing biometrics, medical records, educational profile, voting history.

HMC (Human Medicine Centre) – central hospital with intensive care, operating theatres, perinatal centre and research laboratories.

HMM (Human Medicine Manager) – broad-profile physician using AI diagnostics and capable of performing complex surgeries.

Human Centre – modular multi-storey residential building (type RPB).

Human Unit – residential module (apartment) in a Human Centre.

ICI (Intelligent Cage Infrastructure) – resource exchange system (energy, water, gas) between buildings on a donor-recipient principle.

IEC (Infrastructure Education Centre) – higher education institution for production management, warehousing, transport, infrastructure.

Infrastructure Manager – specialist in the operation of life support systems (energy, water, communications).

Instructor – teacher-psychologist for children aged 7–16 in a specific direction (Math, Bio, Psy, Language, Body, Art).

IT Manager – specialist ensuring reliability of data centres, networks and storage systems.

IT Safe Manager – cybersecurity specialist responsible for protecting information infrastructure, penetration testing, encryption protocols.

K-Airplane – series of unmanned cargo-passenger aircraft (K-Airplane-1,2,3) with hybrid engines for interregional flights.

K-Bus – passenger unmanned minibuses (K-Bus-1,2,3) of different capacities.

K-Crane – mobile lifting crane on a K-Loader-3 platform for modular building construction.

K-Eye – unified video surveillance and monitoring system of Kovcheg, including cameras on buildings, drones, aerostats.

K-Hand – family of manipulator robots for various purposes (assembly, repair, agriculture, animal care).

K-Horse / K-Pony – individual automated segway-type mobility devices for adults and children.

K-Loader – family of unmanned loader-manipulators (K-Loader-1,2,3) for warehouses, construction sites, logistics.

K-Map dot – RFID markers embedded in the road surface every 5 metres for accurate vehicle positioning.

K-Net – unified Kovcheg data network, divided into physically isolated segments (Safe, Learn, Tech).

K-Phone – personal communication device (smartphone) with access to Kovcheg applications and identification system.

K-Protocol – proprietary data transfer protocol operating over IPv6 and used inside Kovcheg.

K-Psychology (Kayology) – scientific-practical system of human upbringing and self-improvement based on reflection, breathing practices, self-discipline and creativity. Later renamed **Kayology** (from Greek καὶ λόγος — “and word”).

K-Truck – unmanned cargo vehicles (K-Truck-1,2,3) of different load capacities.

K-coin – cryptocurrency of Kovcheg, used for external settlements in the first stage.

KOS (Kovcheg Operation System) – proprietary operating system based on the Linux kernel, existing in three versions: KOS Graph (for PCs and smartphones), KOS Server (for servers), KOS Robo (for robots).

LBB (Line-Block-Building) – type of building for industrial and agricultural complexes, assembled from linear modules.

Main Safe Manager – physical security specialist controlling the perimeter, guard drones, non-lethal defence systems.

Material Producer – chemical engineer developing new materials from waste and local raw materials.

MEC (Math Education Centre) – higher education institution for mathematics, physics, engineering, programming.

Medical Unit – medical station in a residential building (PBM module), equipped with diagnostic equipment and staffed by an HMM.

Medicine Manager – Council member, “minister of healthcare”, overseeing all medical services and research.

Mentor – general name for mentors (Psy, Body, Art).

Merged Data – unified database accessible to all AI agents for coordination and analytics.

Nature Manager – ecology and zoology specialist responsible for symbiosis with nature, nature reserves and animal welfare.

Nuclear Producer – nuclear physicist developing mini-reactors for energy supply.

PEC (Psy Education Centre) – higher education institution for psychology, pedagogy, diplomacy.

PMTA (Psy Mentor Type A) – crisis psychologist with skills in non-lethal self-defence and conflict de-escalation, performing the functions of a “police-psychologist”.

Production Manager – engineer-technologist managing automated production lines.

Profile Instructor – high-qualification scientist-teacher, working in research centres and eligible to be elected to the Council.

Project G (Godzilla) – hypervirus developed for extreme defence: capable of disabling an aggressor’s infrastructure without destruction.

Project Alpha – secret research project to create an aircraft based on new physical principles (anti-gravity).

Psy Centre – centre for psychological support, a place for individual and group sessions.

Psy Manager – Council member, “minister of mental health”, overseeing all mentors (Psy, Body, Art) and the development of Kayology.

Psy Mentor – psychologist-mentor helping with mental problems, adaptation, self-reflection.

Pump – breathing exercise for activation: sharp inhale, hold, smooth exhale.

Recycle Hub – waste recycling centre where rubbish is turned into secondary raw materials, biogas, fertilisers.

Recycle Manager – specialist in zero-waste production, managing recycling cycles.

Repair Hub – repair and charging station for vehicles and drones, staffed by Fix Managers.

Resource Manager – Council member responsible for accounting, procurement and distribution of resources inside the autonomy and beyond.

ROE (Resource-Oriented Economy) – economic system based on distributing resources according to needs, without money or private ownership of the means of production.

RPB (Rod-Pie-Building) – type of modular building (residential, public), assembled around a vertical stem with utilities.

RUEC (Reserve Underground Energy Centre) – reserve underground power station for powering data centres in case of failure of primary systems.

Safe Manager – general name for security specialists (Main Safe Manager, IT Safe Manager).

School Centre – centre for primary and secondary education (school, kindergarten, nursery).

SEC (Safe Education Centre) – higher education institution for training security specialists and crisis managers.

Software Manager – programmer-architect developing system and application software for Kovcheg infrastructure.

Sparrow (K-Eye-Sparrow) – small quadcopter for internal video surveillance, returning to its charging station.

Store Unit – “library of things”, where any items (from clothes to equipment) can be borrowed for long-term rental.

Team Leader – coordinator of a group of engineers or managers, appointed by the Council but without privileges, simply responsible for communication.

Technology Manager – Council member, “minister of technology”, overseeing all research centres and engineering projects.

Transport Manager – specialist in transport infrastructure management, logistics, control of unmanned vehicles.

UCC (Underground Computing Core) – underground data centre complex with hot backup and data archive.

UIM (Underground Infrastructure Maze) – network of underground utilities (pipes, cables, tunnels) connecting all buildings to the Central Hub.

Underground Shield – protected underground complex beneath the Central Hub, including the data centre, reserve power station, shelters, secret laboratories.

Vehicle Fix Manager – Fix Manager specialising in ground transport repair.

Vehicle Producer – engineer-constructor of ground vehicles (buses, trucks, loaders).

Warehouse Centre – centralised automated warehouse, combined with a repair hub.

Warehouse Manager – specialist in warehouse management and goods distribution.

Water Producer – chemical engineer dealing with water purification and conservation, studying its properties.

White Hawk – vertical take-off reconnaissance drone with Hypnotist electronic warfare system and solar panels.

PART 1: DIAGNOSIS

Introduction: The Patient — Humanity

Imagine a patient comes to a doctor. He complains of constant fatigue, insomnia, headaches — but continues to smoke, drink, work 20 hours a day, and eat junk food. The doctor prescribes pills, but the patient does not change his lifestyle. A year later he returns with the same complaints, only now new diseases have appeared.

This is roughly what humanity looks like today.

We complain about wars — and continue to spend trillions on weapons.

We are outraged by inequality — and create an economy where 1% owns half of all resources.

We weep about the environment — and cut down forests, burn coal, pollute the oceans.

We want happiness — and chase money, status, likes, which give nothing but a short-term illusion.

Humanity is sick. The diagnosis is complex, chronic, with many complications. But the main problem is not even the diseases themselves — it is that **we refuse to change our lifestyle**.

This book is not a prescription for another pill. It is a proposal to completely rethink how we live. To start from the foundation.

1.1 False Idols: Money, Power, Status

The Myth of Scarcity

At the core of all modern civilisation lies one simple belief: **there aren't enough resources for everyone**.

We believe this as sacredly as our ancestors believed in the wrath of gods. This belief shapes everything: economy, politics, psychology, relationships. If resources are scarce — we must fight for them. The strongest, the cleverest, the richest wins. The rest are losers.

But what if scarcity is an illusion?

Technology already today can provide food, housing, energy and healthcare for every person on the planet. The problem is not production — it is **distribution**. We have created a system where food is destroyed to keep prices high, where medicines are unavailable because of patents, where houses stand empty while millions sleep on the streets.

Scarcity is not objective reality — it is a **tool of control**. It creates artificial competition that forces people to work more for less reward. It turns human relationships into market transactions. It makes us lonely in the crowd.

Money as a Universal Equivalent

Money is a brilliant invention. It allowed humanity to go beyond barter, to create a complex economy, to develop trade. But at some point the means became the end.

Today money measures everything: success, happiness, a person's worth. We say "he is worth a million" — referring not to his human qualities but to the number of banknotes. We are ready to sell our time, health, relationships — just to earn more.

But money has a fundamental limitation: **it cannot create that for which it is worth living**. It cannot replace love, friendship, creativity, the feeling of belonging to something greater. When a person gets everything that can be bought, he often discovers that the most important things cannot be bought.

Power as Compensation

Power is another false idol. People striving for power rarely admit even to themselves that they are running from their own emptiness. Control over others creates an illusion of control over oneself. The more inner chaos a person has, the more he tries to impose order outside — by forcing others.

But power corrupts not because it is evil by nature. It corrupts because it offers the opportunity not to work on oneself. Why change if you can make others adapt to you? Why seek harmony if you can suppress dissonance?

History shows: empires built on power and violence collapse. Always. Because they contradict the main law of human nature — the striving for freedom and self-realisation.

Status as a Drug

Status is the most insidious of idols. It has no material foundation, but it controls people more strongly than money or power. The desire to be better than others, to appear more successful, to receive recognition — this is the engine of a huge industry, from luxury brands to social media.

The problem with status is that it cannot be satisfied. Today you are the best in your neighbourhood, tomorrow in the city, the day after tomorrow in the country. There is always someone higher. The race is endless, but the resource of the psyche is finite. The result: burnout, depression, a feeling of emptiness even when all external attributes of success have been achieved.

Conclusion: money, power, status are not bad in themselves. What is bad is that we have made them our main goals, forgetting that they are only tools. We build houses on sand and then wonder why they crumble.

1.2 The Paradox of Progress: Technology Outpaces Consciousness

Humanity has made an incredible leap in the last 200 years. We have learned to fly, to speak across oceans, to cure diseases that were once death sentences. We have created computers, the internet, artificial intelligence. We stand on the threshold of exploring other planets.

But at the same time we have not learned the main thing — **to live in peace with each other and with ourselves.**

Our technologies are growing exponentially, but our consciousness is growing linearly — if not standing still. We have armed cave-minded man with nuclear bombs. We have given neurotics access to global networks. We have allowed psychopaths to run corporations.

This gap is the main threat of our time. Technologies themselves are neutral. But in the hands of an immature being they become weapons of mass destruction. Social

networks, intended to unite people, separate them, creating filter bubbles and fuelling hatred. Artificial intelligence, which could solve global problems, is used for surveillance, manipulation, and fake creation.

Paradox: we can send a man to the Moon, but we cannot agree on how to feed the hungry. We have decoded the genome, but we do not know how to cure the soul of loneliness.

Why does this happen?

Because technological progress requires one type of thinking — rational, analytical, linear. But human relationships require a completely different type — empathic, intuitive, cyclical.

We try to solve humanitarian problems with technical methods. We build “smart cities”, but the people in them remain just as unhappy. We introduce digital education, but children do not become wiser. We optimise business processes, but workers burn out even faster.

The problem is not with technology — it is with **who and why uses it**.

1.3 Why Utopias Failed

History knows hundreds of attempts to build an ideal society. From ancient philosophers to communist experiments, from religious communes to libertarian startups. All of them failed. Why?

Mistake 1: Ignoring Human Nature

Most utopias were built on the assumption that man could be “remade”. It is enough to create the right conditions, the right laws, the right upbringing — and people will become kind, honest, altruistic.

But man is not a blank slate. He has deep needs, fears, desires that cannot simply be abolished by decree. Attempts to suppress them led either to rebellion or to hypocrisy — outward observance of rules with inner resistance.

Mistake 2: Lack of a Systemic Approach

Utopians often focused on one aspect — the economy, politics, religion — and ignored the rest. Communism promised fair distribution but ignored man’s need for creativity and self-realisation. Capitalism gave freedom of enterprise but created monstrous inequality.

The world is a complex system where everything is connected. You cannot change the economy without changing psychology. You cannot build a just society without giving

people a meaning in life. You cannot solve environmental problems without changing the culture of consumption.

Mistake 3: Violence Against the Individual

The most terrible sin of utopias — the attempt to make man happy by force. When people are forced to be “correct” — sooner or later they explode. Happiness cannot be compulsory. It grows only from freedom of choice, from the person’s inner agreement with how he lives.

Mistake 4: Lack of Self-Renewal Mechanisms

Most utopias were static. They offered a final goal — “paradise on Earth” — and did not provide for development. But the world changes, and any frozen system is doomed to perish. Mechanisms are needed that allow society to learn from mistakes, adapt, evolve.

1.4 Conclusion: We Need a New Operating System

Humanity today resembles a computer trying to run modern programs on an outdated operating system. The processor (technology) overheats, memory (resources) is clogged with junk, and the user (man) understands nothing and presses all the buttons at random.

What is needed?

Not another “patch”, not cosmetic repairs, not a change of signboards.
We need a **complete reinstallation of the system**.

The new OS for humanity must:

1. **Take into account the real nature of man** — not idealise him, but not despise him either. Give room for growth, not pressure.
2. **Be systemic** — cover all spheres of life: psychology, economy, ecology, technology, governance.
3. **Respect freedom** — not force happiness, but create conditions in which a person himself wants to become better.
4. **Be able to update** — have built-in mechanisms for reflection, feedback, and error correction.
5. **Have meaning** — answer the question “why?”, give a goal that goes beyond individual survival.

This operating system is called **Kovcheg**.

It is not ideal. It does not claim to be the ultimate truth. It is a **working version 0.1**, which must be refined, tested, improved.

But it has one important advantage over all previous attempts: it is created not to freeze in eternity, but to **evolve together with humanity**.

Epilogue to Part 1

The diagnosis is made. The patient — humanity — is indeed gravely ill. But unlike many incurable diseases, this one has a chance of healing. Because its causes are not fate, not gods, not “human nature” as such — but **how we have organised our lives**.

And organisation can be changed.

Next, we will talk about how exactly. About a new psychology that allows a person to become Human 2.0. About the crystal from which a new society grows. About cities where technology serves life, not the other way around. About space that awaits us if we learn to live in peace on Earth.

But first — **the diagnosis is realised**. And that is already half the way to recovery.

PART 2: K-PSYCHOLOGY — KAYOLOGY

Engineering Humanity

Note on terminology:

In the first edition, this system was called “K-Psychology” (Kovcheg Psychology). Later, the author and his co-author gave it a new name — **Kayology** (from the Greek *καὶ λόγος* — “and word”), reflecting the importance of dialogue, inner speech and conscious communication.

In this translation both terms are kept as synonyms, but the core of the system remains unchanged.

Introduction: Why Psychology Comes First

In any other future-building project, people start with technology. Robots, AI, cities, energy. That is understandable, tangible, you can draw it on blueprints.

But Kovcheg does not start with hardware. It starts with the soul. Why?

Because **a robot cannot be happier than its creator**.

Because **an AI cannot be wiser than its programmer**.

Because **a city cannot be more harmonious than its inhabitants**.

Technologies are merely tools. A hammer can be used to build a house or to smash a neighbour's head. The difference is not in the hammer, but in who holds it.

Humanity has created incredible tools but has not learned the main thing — to be human. We armed a neurotic with a nuclear button, gave a psychopath access to global finance, allowed an anxious teenager to manipulate millions through social media algorithms.

The result is predictable.

Kovcheg proposes to stop and ask the most uncomfortable question: **what if the problem is not technology, but ourselves?** What if, before building an ideal city, we need to build an ideal (no, not ideal — **healthy**) human being?

Kayology is not just another psychotherapeutic school. It is an **engineering approach to consciousness**. An attempt to create an operating system for the human psyche, so that we can finally use our enormous technological potential for good rather than for harm.

2.1 Three Layers of Human Imperfection

Before treating, we must understand what hurts. Kayology identifies three levels of problems a person faces.

Layer 1: Unprocessed Trauma

A person is not born with a blank slate, but with pages already written. Childhood trauma, family scripts, cultural codes, the historical memory of ancestors — all of this lives within us, even if we do not realise it.

Pain that has not been lived through does not disappear. It sinks deep and becomes a **blind spot** — a place where we lose the ability to see reality. A person betrayed in childhood will see betrayal everywhere, even where it does not exist. One who has survived hunger will hoard food even when it is abundant.

These blind spots rule us from the shadows. They force us to make decisions that harm us and others. They create behavioural patterns repeated from generation to generation.

Layer 2: Lack of Self-Discipline

Traumas are roots. But even if the roots are healthy, the tree must be grown. Self-discipline is the ability to keep focus on what is important rather than on momentary pleasure.

In the modern world, self-discipline has atrophied. From childhood we are trained for instant gratification: hungry → order delivery, bored → turn on the phone, want

attention → post a like. We lose the capacity for sustained effort, for patience, for working on ourselves.

Without self-discipline, no transformation is possible. You can understand your traumas, realise them — but if there is no will to change behaviour day after day, the realisation remains merely an interesting theory.

Layer 3: Lack of Meaning

Even if traumas are processed and discipline exists, the main question remains: **why?**

The modern world has destroyed all traditional sources of meaning. Religion has faded, ideologies have been discredited, national ideas often lead to conflict. All that remains is individual survival and consumption. But man is not an animal. He needs to be part of something larger than himself.

Without meaning, any activity turns into meaningless hustle. People can be rich, healthy, successful — and yet deeply unhappy, because they do not understand what it is all for.

2.2 Kayology: Not Healing, but Designing

Conventional psychology works with illness. A patient arrives — we treat the symptom. Depression → antidepressants. Anxiety → therapy. Conflict → mediation.

Kayology works differently. It does not heal — it **designs health**.

Imagine the difference between repairing a broken car and creating a perfect new one from scratch. In the first case, you are limited by the old construction. In the second, you can build in the best from the very beginning.

Kayology offers not to repair the old human, but to **grow a new one**. Human 2.0, who has:

- **Awareness** instead of automatic reactions
- **Self-discipline** instead of chaotic impulses
- **Meaning** instead of consumer emptiness
- **Empathy** instead of competition
- **Creativity** instead of destruction

This does not mean we must destroy the old human. It means that inside each of us there is already the seed of the new. The task of Kayology is to create conditions for this seed to sprout and become dominant.

2.3 Tools of Kayology

Breathing as Basic Tuning

Breathing is the most underestimated tool in the human arsenal. We breathe automatically, not noticing it. But breathing is the bridge between body and mind, between the automatic and the voluntary.

When a person is frightened, breathing becomes shallow and rapid. When calm — deep and slow. The feedback also works: if you consciously slow your breath, your body “understands” that there is no danger and calms down.

Kayology uses breathing as a **remote control for the state**:

- **Black Point** — a relaxation technique after strain. The person sits or lies down, closes eyes, imagines a black dot, inhales deeply through the nose and exhales slowly through pursed lips. 5 minutes — and the brain reboots.
- **Pump** — preparation for active work. Standing, back straight, sharp inhale through the nose, hold for 3 seconds, smooth exhale through the nose. 3-5 minutes — and the mind is fully engaged.
- **Concentration** — for those who work at a computer. Focus on a distant object (inhale), switch to a close object (exhale). 2 minutes relieve eye strain and restore attention.
- **Collective practices** — synchronised breathing of a group. When people breathe in the same rhythm, their consciousnesses synchronise. This is not mysticism but physiology: the rhythm sets a common state, and the common state gives birth to common understanding.

Reflection as Daily Maintenance

If breathing is a reboot, reflection is diagnostics. Every day a person must stop and ask himself:

- What did I feel today?
- What caused those feelings?
- How did I react?
- Could I have reacted differently?
- What did I learn today?

It sounds simple. Yet most people never do it. They live through days, weeks, years on autopilot, not understanding why their life goes the way it does.

Kayology makes reflection **mandatory but not forced**. Everyone has a Psy Mentor who helps ask the right questions. But the answers a person finds himself — because only answers found independently have real power.

Collective Reflection

Individual reflection heals personal wounds. Collective reflection creates a shared field of meanings.

In a group that meets regularly for collective reflection, a **common language for describing reality** gradually forms. People begin to understand each other not at the level of words, but at the level of states. Conflicts that would take weeks of negotiation in the ordinary world are resolved in minutes — because everyone has already learned to hear not only arguments, but also the feelings behind them.

Collective reflection after breathing practices (Collective Relax, Collective Wind, Collective Black Point) is the **highest mastery** of Kayology. When the group is synchronised through breathing, any discussion proceeds at a qualitatively different level. No defence, no masks, no desire to win an argument. Only a shared search for truth.

2.4 The Role of Mentors: Psy, Body, Art

Man is a complex being. You cannot work only with the psyche, ignoring the body. You cannot develop the intellect, forgetting about creativity. Therefore, in Kayology three types of mentors work together:

Psy Mentor — A Guide to the Inner World

This is not a psychotherapist in the classical sense. Psy Mentor does not heal, does not give diagnoses, does not prescribe pills. He **helps a person to understand himself on his own**.

How it works:

- He asks questions, does not give answers
- He creates a safe space where one can be vulnerable
- He sees patterns that the person does not notice in himself
- He supports, but does not rescue

Psy Mentor does not say: "You have a problem." He says: "Let's see what is happening. What do you feel? What does this remind you of from the past? How would you like to react instead?"

Psy Mentor's main tool is **trust**. The person must know: whatever he says, he will not be judged, used, or ridiculed. Only in such an atmosphere is true reflection possible.

Body Mentor — Architect of the Body

The psyche and the body are not two separate objects, but two sides of the same whole. Tension in muscles creates tension in thoughts. Chronic clamps form chronic fears. Incorrect breathing — anxiety.

Body Mentor works with the body as an instrument of the soul:

- Selects individual loads — not sport for records, but movement for health
- Helps to recognise and release physical blocks
- Teaches to feel the body, to hear its signals
- Synchronises breathing and movement

In Kovcheg there are no bodybuilders exhausting themselves in gyms. There are people who do exactly as much as needed so that the body does not interfere with living and thinking.

Art Mentor — Guide to Creativity

Creativity is a natural “valve” for emotions. Inside every person there is energy seeking an outlet. If it is not given a constructive channel, it will find a destructive one: aggression, self-harm, addiction.

Art Mentor helps a person **find his own form of creativity**. Not to teach drawing, but to help discover that drawing is a way to talk to oneself. Not to teach violin, but to show that music is a language for expressing that for which words do not exist.

The form of creativity does not matter. The process matters. Someone finds himself in clay, someone in programming, someone in dance, someone in embroidery. Art Mentor does not judge the result — he rejoices in the very fact of creativity.

2.5 Difficult Cases: Psy Mentor Type A (PMTA)

Most people in Kovcheg follow their path of development gently, with the support of a Psy Mentor. But there are those whose pain is so great that they begin to harm others. For such cases, there exists **PMTA** — Psy Mentor Type A (crisis psychotherapist).

PMTA is not a police officer. He is a **psychologist with extended authority and special training**.

How PMTA differs from an ordinary Psy Mentor

1. **Additional training:** crisis psychology, conflict de-escalation, aikido (using the opponent's energy), non-lethal defensive tools.
2. **Right to intervene:** when a person poses a real threat to themselves or others, PMTA may act without waiting for consent.
3. **Work regime:** rotation to prevent burnout, mandatory vacations, supervision.

How PMTA works

1. **Dialogue — always first.** PMTA tries to understand what lies behind destructive behaviour. Pain? Fear? Despair? Often, when a person feels heard, the aggression dissipates by itself.
2. **If dialogue fails** — PMTA uses non-lethal means (Freezer foam, Net-Worker net, minimal-force electroshocker) just enough to immobilise and prevent harm.
3. **After the incident** — not punishment, but intensive therapy. PMTA stays with the person, helps them survive the crisis, find the roots of the problem.
4. **Reintegration** — gradual return to society with support.

Why PMTA do not become punishers

- **Rotation:** 3 months of field work, 1 month of rest, 1 month as an ordinary Psy Mentor. The person does not have time to “ossify”.
- **Supervision:** every difficult case is reviewed with a supervisor.
- **Ethics:** from the very beginning, PMTA are taught that their task is not to punish, but to bring the person back to themselves.

2.6 AI Psychologist: An Outside Perspective

A human has blind spots. A Psy Mentor helps to see them, but he also has his own limitations. The third level of observation is the **AI Psychologist**.

This is not an artificial intelligence that heals people. It is an **analytical system** that:

- Analyses reports from Psy Mentors (anonymised)
- Identifies patterns: which problems occur most often, which methods are more effective, where systemic failures may occur
- Helps the Psy Manager see the overall picture of the autonomy’s mental health
- Detects early signs of burnout among the mentors themselves

The AI Psychologist does not replace a human. It gives data, and the human makes decisions. Like a microscope for a biologist: it shows, but does not interpret.

2.7 Psy Manager: Minister of Souls

All mentors (Psy, Body, Art, PMTA) do not work in a vacuum. Their work is coordinated by the **Psy Manager** — a member of the Coordination Council responsible for the mental health of the entire Kovcheg.

This is not a bureaucratic position. The Psy Manager is the **most experienced psychologist** in the autonomy, having passed all levels of training. His tasks:

1. **Strategy** — development of Kayology, introduction of new methods, training of mentors.
2. **Ethics** — ensuring that no one abuses influence.
3. **Difficult cases** — if PMTA cannot cope, the Psy Manager steps in.
4. **Veto power in the Council** — if any Council decision threatens the mental health of citizens, the Psy Manager can block it.

In the Council, the Psy Manager is the voice of the most vulnerable part of every person — the part that might be harmed by too rapid progress, too harsh decisions, too cold efficiency.

2.8 Kayology in Action: One Day

Morning. 7:00. The Ivanov family.

Igor (Transport Manager), Milana (Human Medicine Manager), Misha (12 years old) and Anna (5 years old) wake up. The first 10 minutes — breathing exercises together as a family. Collective Pump, to get energised for the day.

At breakfast — a short reflection: “What did you dream about?”, “What are you feeling this morning?”, “What would you like from today?” Children learn to name their feelings, adults learn to listen.

Work. 10:00. Transport Hub.

Igor has a difficult meeting with colleagues. Before they start — 3 minutes of collective breathing. People who were just rushing about sit in a circle and synchronise. When they open their eyes, arguing no longer feels necessary — they want to find a solution together.

Day. 15:00. Medical Unit.

Milana sees an elderly patient. The woman complains of anxiety. Milana checks her bracelet readings — physically everything is fine. She does not prescribe pills. She simply sits down and asks: “Tell me, what happened?” After 20 minutes of dialogue it turns out the anxiety is linked to her grandson having moved to another autonomy. Milana does not solve the problem. She helps the woman find her own way: schedule a video call in the evening, start writing a diary of memories for the grandson.

Evening. 20:00. Art Center.

Anna, aged 5, picks up clay for the first time. The Art Mentor does not say “make a bunny”. He just gives her a lump and stays silent. Anna squashes it, taps it, tears it. After 10 minutes she says: “This is anger. Anger that Misha didn’t give me his toy.” The Art Mentor smiles: “Excellent anger. Now can you turn it into something else?” Anna thinks, and sculpts... a butterfly. Anger became a butterfly.

Night. 23:00. Human Center.

Before sleep, Igor and Milana spend 5 minutes on personal reflection. Each writes in their notebook: what was good today, what was difficult, what they learned. Then they exchange a few words. It is not analysis, not a debriefing. It is just being together, even after a long day.

2.9 The Philosophical Foundation of Kayology

At the foundation of Kayology are several principles that can be called **axioms of the new human**:

1. **A person is not born bad or good. He becomes what circumstances, environment, and he himself teach him.**
There is no "evil nature". Only unprocessed pain. No "bad people". Only people whom no one helped to understand themselves.
2. **Awareness is the first step toward change, but not the last.**
You can understand everything about your traumas and still continue to suffer. Because knowledge without action is just information. Only regular practice transforms the structure of personality.
3. **Self-discipline is not violence against oneself, but care for one's future self.**
When a person says, "I will not eat this junk food," he is not forbidding himself pleasure. He is choosing: tomorrow's health is more important than the momentary taste.
4. **Creativity is the natural outlet for energy.**
Energy cannot be destroyed. It can only be directed. Creativity is the most constructive channel. If it is absent, the energy will find another: aggression, self-destruction, illness.
5. **We are part of a whole.**
An isolated person is unhappy. Happiness is possible only in connection with others. Kayology does not cultivate individualism. It cultivates a personality that is aware of itself as part of society and nature.

2.10 Transition: From the Individual to Society

When a person has processed his traumas, learned discipline and found meaning — he is ready for the next step. To live in a society where similar people come together to build a common future.

Kayology is the **foundation of Kovcheg**. Without it, all technologies, all cities, all plans for space exploration remain just beautiful blueprints.

But with it — the most interesting begins. Because a group of healthy people is no longer just a group. It is a **crystal** from which a new world can grow.

About how that crystal grows — in the next part.

PART 3: THE CRYSTAL — BIRTH OF A NEW SOCIETY

Introduction: From Seed to Sprout

In the previous part we spoke about how a person becomes Human 2.0 — through awareness, discipline, creativity. But even the most perfect human living alone will not create a civilisation. The next step is needed: **assembly**.

Imagine a supersaturated solution. It already contains everything necessary for crystal growth, but it needs a seed — a tiny particle around which ordering begins. Without it, the solution remains chaotic, even if the potential is enormous.

In human society, such a seed becomes **the Crystal** — a group of people who:

- Have passed through Kayology (or at least recognised its necessity)
- Share the core values of Kovcheg
- Are ready to act, not just dream
- Are able to reach agreements even in the most difficult situations

From this tiny core will grow first a settlement, then a city, then a network of autonomies, and eventually — a new civilisation. But everything begins with the small. With 10, 20, 50 people who decide: "Enough waiting. Let's begin."

3.1 Selection: Who Enters the Crystal

The first and most difficult stage — to find those capable of becoming part of the core. Not just "sympathisers", not just "enthusiasts", but people possessing three qualities:

1. Psychological resilience

The first years will be hard. No ready-made infrastructure, no guarantees, only endless problems and the resistance of the outside world. A person who breaks down at the first difficulties will not survive. We need those who already have an inner spine — or who have gone through sufficiently deep Kayology to grow that spine.

2. Competence

The Crystal must include specialists of different profiles: psychologists, engineers, diplomats, ecologists, doctors, builders, programmers. You cannot build a city with philosophers alone. You cannot create a stable society with engineers alone. A balance is needed.

3. Capacity for dialogue

This is perhaps the rarest quality. People accustomed to the competitive world often do not know how to negotiate. They either bulldoze their point of view, or yield but

harbour resentment. The Crystal needs those who are ready to **search for truth together**, not to prove their own rightness.

How selection happens

First stage — an **online platform** open to everyone interested in the ideas of Kovcheg. Materials are published, webinars held, concepts discussed. But this is not enough.

Those who pass the initial screening (filled out questionnaires, showed themselves in discussions) are invited to **in-person meetings**. Not interviews, but meetings where people can see each other face-to-face, talk informally, try to solve simple tasks together.

The most important stage — **testing**. Not in the sense of exams, but of immersion in real situations. A group of 10–15 candidates is housed together for a week and given a task: design a small structure, assign roles, agree on living rules. They are observed by experienced Psy Mentors, but not interfered with. The result reveals everything: who takes responsibility, who retreats into the shadows, who conflicts, who seeks compromise, who cannot handle the stress.

After such a week it becomes clear who is truly ready to become part of the Crystal. The selection is tough but fair. It is better to reject a potentially problematic person now than to let the core disintegrate later.

3.2 Grinding: Diamond Sharpens Diamond

When the first 20–30 people are selected, the most difficult process begins — **grinding**. People, each accustomed to their own picture of the world, their own methods, their own rhythm, must learn to live and work as a single whole.

This does not happen automatically. The first weeks (sometimes months) are full of conflicts, misunderstandings, resentments. Everyone believes their own opinion is correct. Everyone wants it their way. Everyone pulls the blanket in their own direction.

What helps to get through this stage

1. A common goal. Everyone in the Crystal understands: if we fall out now, nothing will be achieved. No city, no future, no salvation. This goal acts like a magnet, holding people together even when they want to run away.

2. Kayology. Each person already possesses the basic tools: reflection, breathing practices, the ability to hear the other. When a conflict reaches a dead end, someone suggests: "Stop. Let's breathe for 2 minutes and then continue." And it works.

3. An external facilitator. In the early stages, the group may not have a person capable of managing conflicts from within. Then an experienced Psy Mentor from outside is invited (someone who has already been through this stage in another project or has

extensive group experience). He does not solve problems for the group, but helps it see its own blind spots.

4. Clear procedures. From the very beginning, rules for discussion are introduced: one speaks — others listen, no personal attacks, breaks when overheated. This is not a restriction of freedom, but protection against chaos.

A story from the life of a hypothetical Crystal

The first general meeting. Discussing where to lease land. Proposals vary: Europe, Asia, Latin America. Everyone gives arguments, everyone is convinced they are right. After an hour the discussion turns into a quarrel. Someone raises their voice, someone falls silent in offence.

Then one of the participants (who has PMTA training) says: "Stop. Let's take a pause. 5 minutes of breathing, then continue." The group reluctantly agrees. After the pause, the atmosphere changes. It is no longer "I am right" but "how can we find the best solution". Someone suggests a method: everyone writes their arguments on a board, then the group looks for overlaps. After 2 hours they reach a consensus: start in a country with the most stable legislation and openness to innovation, even if it is more expensive.

That is a small victory, but it is from such victories that the group's capacity for self-organisation is built.

3.3 Principles of Governance within the Crystal

The Crystal is a prototype of the future Autonomy Council. It lays down the principles that will later be scaled to the whole society.

Unanimity as a goal

In the Crystal there is no majority voting. If even one person is against — the decision is not taken. Why? Because the dissenter may see what the others do not see. His resistance is not stupidity or malice, but a signal that the solution has not been sufficiently refined.

Of course, this takes time. Sometimes discussing a single question takes days. But in the end a solution is found that **truly takes all aspects into account**, not just satisfying the majority.

The role of argumentation

If someone opposes, they must explain why. Not just "I don't like it", but in detail: what risks they see, what alternatives they propose, what evidence would change their mind. The others must listen and try to understand, even if at first glance the objection seems far-fetched.

Absence of a formal leader

In the Crystal there is no “chief”. There are coordinators for each area, but they are chosen temporarily for specific tasks and have no privileges. Anyone can take responsibility for a project if they prove they can handle it.

This is not anarchy. It is **meritocracy** — not in the sense of “rule by the best”, but “rule by those who are ready to take responsibility and prove their competence by deeds”.

Role rotation

To prevent anyone from “sitting too long” and becoming accustomed to power, roles are rotated regularly. Today you coordinate negotiations with authorities, tomorrow you handle procurement, the day after you work on construction. This gives everyone an understanding of the whole picture and prevents the emergence of a caste of “indispensables”.

3.4 First Decisions and First Documents

The Crystal cannot exist without formal foundations. In the first stage, they develop:

The Charter of Kovcheg

A basic document fixing:

- The goals and values of the project
- Principles of governance (unanimity, rotation, absence of privileges)
- Procedures for entry and exit
- Relations with the outside world
- Mechanisms for amending the Charter itself (by consensus)

The Charter is not dogma. It can change, but only with the agreement of all.

The Ethical Code

Not so much a set of prohibitions as a description of desirable behaviour patterns:

- Respect for others’ opinions
- Openness in discussions
- Care for the common cause
- Responsibility for commitments taken
- Help for those in need

The Code is not imposed — it is developed by the group itself through discussion. This makes it alive, not formal.

First business plan (for the outside world)

To obtain land and resources, the Crystal must present the project not as a utopia but as an **investment-attractive technological cluster**. A document is developed in which Kovcheg is described as:

- An innovation centre for AI and robotics
- An experimental site for green technologies
- A new-type educational cluster
- A tourist-attractive ecovillage

No lies, just the emphasis shifted toward categories that the outside world understands.

3.5 Working with the Outside World: First-Level Diplomacy

The Crystal cannot exist in a vacuum. It must interact with states, investors, local communities. For this, people with special skills are needed — **External Relations Manager (ERM)**.

ERMs are diplomats of a new type. They:

- Speak several languages
- Understand the psychology of negotiations
- Can explain complex ideas simply
- Build long-term relationships rather than extract short-term gains

Their task is to present Kovcheg in a way that evokes not fear but interest. Not “we are building a new society”, but “we are developing technologies that will help your country”. Not “our ideology is different”, but “we are experimenting with efficient governance models”.

At the early stage, ERMs look for **pilot jurisdictions** — countries with a stable political system, interested in innovation, ready to grant special status (SEZ, free economic zone). The ideal option is not large powers with rigid bureaucracy, but small states that want to attract technology and talent.

Negotiations are long and hard. Many refuse. But one success outweighs a hundred rejections.

3.6 First Settlers: How to Expand the Crystal

When legal issues are resolved, the recruitment of **first residents** begins. These are no longer the core, but those who will come to build ready-made houses and work in factories.

The selection criteria here are softer, but still strict:

- Basic understanding of Kayology (at least an introductory course)
- No serious psychological problems (tested)
- Willingness to abide by the Charter and rules
- Possession of a sought-after profession or willingness to learn

Each candidate is interviewed by members of the Crystal. Not to “reject”, but to understand: will this person fit into the community? Will they be comfortable? Will they become a source of conflict?

Rejection does not mean the person is bad. Simply that they do not fit this particular group at this particular stage. Perhaps later, when the community becomes larger and more diverse, they can join.

3.7 First Conflict and First Victory

In any community, sooner or later a crisis occurs. In the Crystal it is inevitable. The question is not how to avoid it, but how to go through it without destruction.

Example of a hypothetical crisis

Six months after the start of construction, it turns out that one member of the Crystal, responsible for procurement, made a mistake. Incompatible equipment was purchased. The loss — several hundred thousand dollars (investors’ money).

Reactions vary. Some demand punishment, expulsion from the Crystal. Others defend him, saying mistakes are inevitable. The group splits.

What does the Crystal do?

First — a pause. For several days no decisions are taken, everyone continues with current work, but internal tension grows. Then a meeting is called — not to judge, but to understand.

A collective reflection process is organised. Each person says what they feel: anger, disappointment, fear, desire to protect. A Psy Mentor helps the group not to slide into mutual accusations.

Then they move to facts. It turns out the mistake was not malicious, but the result of overload and insufficient technical competence. The guilty person accepts responsibility, but asks for a chance to make it right — they have already found a way to resell the equipment and buy the right one with minimal losses.

The group votes — not on punishment, but on trust. The decision is unanimous: give a chance, but tighten control over procurement and introduce mandatory collective discussion of large expenditures.

This crisis did not destroy the group — it made it stronger. New procedures appeared, mutual trust grew, everyone learned that their mistake is not the end of the world but an opportunity to learn.

3.8 From Crystal to Autonomy

When the Crystal numbers several dozen people, when the first houses are built, when the first production lines are launched, the next stage begins — **transformation into an autonomy**.

The Crystal ceases to be simply a group of like-minded people. It becomes the **Coordination Council** of the first settlement. Some of its members remain in the Council, others go into practical work — managing factories, farms, schools.

The first **managers** appear:

- Infrastructure Manager (buildings and roads)
- Energy Manager
- Production Manager
- Resource Manager
- Education Manager
- Medicine Manager
- Main Safe Manager (physical security)
- And of course **Psy Manager** — minister of souls

The Council now works not for survival but for development. The first external contacts appear, first exchanges with neighbours, first tourists (who must be welcomed but also controlled).

The Crystal does not disappear — it becomes the **core inside a larger body**. Its members still set the tone, but they are no longer alone. Beside them live hundreds of people who came later and did not go through the same grinding process. This creates new challenges.

3.9 Lessons of the Crystal

What does the experience of the Crystal give?

1. **Consensus skill.** People who have learned to negotiate in a small group can transmit this skill to the whole society. They become living examples that dialogue is possible.
2. **Shared memory.** The Crystal keeps the history of its creation, remembers the crises it went through. This memory is protection against repeating mistakes.
3. **Personnel reserve.** From the Crystal grow leaders for all directions — not because they are “appointed”, but because they have proven their ability to lead.

4. **Cultural benchmark.** How the Crystal members communicate, work, rest becomes the norm for all new settlers — not through coercion, but through natural imitation.
5. **Trust.** The outside world, seeing a cohesive group capable of solving difficult problems, begins to take Kovcheg seriously. Investors, authorities, partners — all feel the difference between a “paper project” and a living community.

3.10 Limits: What the Crystal Cannot Do

It is important to understand its limitations.

The Crystal cannot:

- Replace the whole society. It is only the seed.
- Solve all problems once and for all. Each stage of development brings new challenges.
- Guarantee that future generations will preserve its values. That is a matter of continuous transmission of experience.
- Be perfect. There will be mistakes, conflicts, disappointments.

But the Crystal can give the most important thing — the **initial impulse**. The very push that turns the chaos of possibilities into orderly motion.

Transition: From Core to Organism

When the Crystal is formed, when the first buildings are erected, when the first systems start working, the most interesting begins — **life of the autonomy**.

Now it remains to test how the ideas work at scale. How hundreds, then thousands of people will live by principles worked out by a few dozen. What new problems will arise and how to solve them.

About that — in the next part.

PART 4: AUTONOMY — THE CITY AS AN ORGANISM

Introduction: When Ideas Take Flesh

The previous parts were about the individual and about the group. About healing the soul and gathering a core of like-minded people. But sooner or later the moment comes when talk ends and construction begins.

An autonomy is not just a “city of the future”. It is a **living organism**, in which every detail is connected to every other, where infrastructure serves people, not the other way around. Where technology does not oppress but liberates. Where nature is not destroyed but restored.

In this part we will descend from philosophical heights to the ground. Literally. We will talk about how houses, roads, factories, farms, energy systems are arranged. How people move, how they get food, how they are treated, how they learn, how they rest. And most importantly — how all this works **without money**, on the principles of ROE (Resource-Oriented Economy).

A warning: there will be many details. But each of them is not just a “technical solution” — it is an embodiment of philosophy. Read carefully: behind concrete and wires lies the answer to the question “how to live like a human being”.

4.1 Master Plan: A Circle in the Desert

If you look at the Kovcheg autonomy from a bird’s-eye view, you will see a **perfect circle**. This is not an accident and not an aesthetic whim.

Why a circle?

- **Shortest perimeter** for a given area — less wall, less defence cost.
- **Equal distance from the centre** — all sectors are in the same conditions, no “outskirts” vs “centre”.
- **Spider-web logistics** — roads inside the circle can be organised as a network, where from any point to any other there are several equivalent routes.

Structure

The circle is divided into 9 sectors (districts), marked by letters A through I. District I is in the centre. There lies the **Central Hub** — the administrative and technological heart of the autonomy. Around it, clockwise, are residential and industrial districts.

The outer boundary is the **Circle Shield** — a 5-metre-high protective ring made of composite materials, going 3 metres into the ground (protection against digging). Along the perimeter are cameras, sensors, automatic gates at the four cardinal points: North Gate, South Gate, East Gate, West Gate.

Beyond the circle is the **mobile resources zone**: wind and solar power stations that can be moved according to the season, as well as a runway for K-Airplane aircraft.

4.2 Architecture: Modules from Which Everything Is Assembled

The main principle of construction in Kovcheg is **modularity**. Almost everything, from residential buildings to factories, is assembled from standard blocks produced on site.

Two main types of buildings

RPB (Rod-Pie-Building) — residential and public buildings

Imagine a layered pie threaded onto a vertical rod. The rod is the **Rod-B-Module**, containing all the utilities: lifts, pipes, wires, ventilation. Around the rod are **Pie-B-Modules** — removable “pie slices”, each representing a separate room.

A residential module (Human Unit) — a three-room apartment plus bathroom. Up to 8 such modules per floor. Up to 20 floors. On the ground floor — public spaces: entrance hall, Medical Unit, Food Center, Body Center, Store Unit.

The roof — solar panels and rainwater collectors. The basement — an energy centre with a biogas turbine generator and water accumulators.

The special feature of RPB: any module can be replaced without dismantling the whole building. If a family needs more space, two adjacent Human Units are installed instead of one. If the district needs another Food Center, several residential modules on a floor are replaced. The building lives and changes with the people.

LBB (Line-Block-Building) — industrial and agricultural buildings

These are long one-storey (or two-storey) structures stretched out in a line. Inside — production lines. LBB is also modular: from standard blocks (Start-End-Block, Center-Block) you can assemble buildings of any length and configuration.

LBB houses factories, hydroponic farms (Green Center), recycling complexes. There are no windows (except for farms that need light), everything is automated, mostly robots work there.

Construction

Modules are produced in a special **Building Production Centre** using K-Builder-3D 3D printers and K-Hand-Build robotic manipulators. On-site assembly is done with mobile cranes K-Crane (on a K-Loader-3 platform). The whole process is controlled by an AI builder and supervised by a Construction Manager.

The speed of erection is striking: a 10-storey building can be assembled in 2–3 weeks. This is not fantasy — it is the result of modularity and automation.

4.3 Energy: Every House a Power Station

Kovcheg does not depend on external energy sources. Moreover, it does not even depend on a single internal grid.

Decentralisation principle

Every RPB-type building (residential) has:

- Solar panels on the roof
- Rainwater collectors (drinking and technical water)
- Biogas turbine generator in the basement
- Solid-state accumulators

Biogas is obtained from organic waste from residents' life activities (through separators in the sewage system). The generator's heat in winter goes to heating. Water is purified and reused.

During the day the house runs on solar power, storing surpluses. At night or in cloudy weather, it switches to the generator. If the generator is insufficient, it can draw energy from the common grid (but that is rare).

Common grid as backup

All buildings are connected by underground utilities (UIM — Underground Infrastructure Maze). Through them, electricity, gas, water can be transferred. The principle of **donor-recipient** works: if one house has excess, it gives to neighbours. If everyone has excess, the energy goes to industry (LBB) or is stored in central accumulators.

Centralised power stations (solar fields and wind turbines outside the perimeter) also exist, but they serve as backup and to power heavy industry.

Management

Everything is managed by the **AI Energy Manager**, which collects data from all buildings, forecasts consumption and weather, redistributes flows. It is supervised by a human **Energy Manager**, who monitors the balance and makes decisions in abnormal situations.

4.4 Water and Waste: Closed Loop

In Kovcheg there is no concept of "rubbish". There are only **resources temporarily in the wrong form**.

Water

Each building collects rainwater and condensate water. It purifies it in several stages. Drinking water goes to taps, technical water to toilets and irrigation. After use, water goes to a separator, where organic matter is separated and the water is purified again (to technical standard). A closed loop: water does not leave the autonomy, only replenished by rain.

Waste

In each Human Center there are containers for 6 types of waste:

- Organic → biogas
- Plastic → recycling
- Cardboard/paper → recycling
- Rubber → recycling
- Synthetic fabric → recycling
- Metal → smelting

There is a **Recycle Scanner** — a device that helps determine where to throw an item if a person is unsure.

All waste is taken to the **Recycle Hub** — a recycling centre. There it is crushed, sorted, turned into raw material for production. Organic goes to biogas. Metal to smelting. Plastic and rubber into granules for 3D printers.

This is managed by the **Recycle Manager**. His task: to ensure that not a single molecule leaves the cycle without being used.

4.5 Transport: No Drivers, No Traffic Jams

Kovcheg has no private cars. None at all. Transport is shared, driverless, summoned on demand via an app.

Types of transport

Ground:

- **K-Bus (1,2,3)** — passenger minibuses for 6, 10 and 30 people.
- **K-Truck (1,2,3)** — trucks for 1.5, 5 and 10 tonnes.
- **K-Loader (1,2,3)** — loader-manipulators for warehouses and construction sites.
- **K-Horse / K-Pony** — personal mobility devices (segway-type) for adults and children, speed up to 20 km/h.

Air (only for external connections and emergencies):

- **K-Airplane (1,2,3)** — hybrid-engine cargo-passenger aircraft, range up to 10,000 km.
- **White Hawk** — reconnaissance drone.
- **Disk Defender (DD-1,2,3)** — security drones.
- **Sparrow** — small drones for indoor surveillance.

How it works

Roads inside the autonomy form a web-like network. Every 5 metres — RFID markers (K-Map dot) that allow vehicles to determine their exact location even if GPS fails.

An AI logistician manages all movements. It knows where each vehicle is needed, plans routes, avoids intersections. If an obstacle appears on the road (e.g. a fallen drone), the system instantly reroutes traffic.

Speed limits: personal mobility devices — 20 km/h, buses — 60 km/h, loaders — 20 km/h. No accidents — all vehicles communicate with each other and with the road.

Emergency modes

If a vehicle loses contact with the AI, **Go-to-Home** mode activates. The onboard electronics read the road markers and guide the vehicle to the nearest repair hub at low speed with hazard lights.

If that fails too — **Auto-Stop** triggers: the vehicle simply stops and locks its wheels to avoid an accident. The AI logistician sends a tow truck.

4.6 Production: Only What Is Needed

Kovcheg has no factories operating for stock. Production is launched **only in response to real demand**.

How it works

1. The AI warehouse tracks how many items remain in the Store Units (pick-up points).
2. When stock falls below threshold, the AI places a production order.
3. The order goes to the Production Centre.
4. Robots (K-Hand-Install, K-Hand-Install-Sync) assemble exactly what is needed.
5. Finished products go to the warehouse and from there to Store Units.

Production features

- **Two lines** (even and odd). They work alternately: while one line produces, the other is maintained (diagnostics, repair). This ensures continuity.
- **Modular equipment**: conveyor lines can be quickly reconfigured for a different product by replacing a few modules.
- **No lighting**: factories operate in darkness (robots do not need light), saving energy.

Who manages

Production Manager — an engineer responsible for the factory's operation. There are two per facility (one per shift). They ensure the robots do not make mistakes and, when necessary, repair them (together with Fix Manager).

4.7 Food: From Farm to Plate

Kovcheg is vegetarian. Not for ideological reasons, but for scientific ones: research shows that animal products promote the growth of cancer cells. However, this does not mean residents eat only grass.

Hydroponic farms (Green Center)

Huge greenhouses built with LBB technology, where vegetables, fruits, berries are grown on multi-tiered racks. Fully automated: an AI agronomist monitors lighting, watering, nutrient solution composition. K-Hand-Green robots harvest the crops.

Synthetic food

At the **Food Research Center**, scientists (Bio Profile Instructors) develop products indistinguishable from meat in taste but completely plant-based. From algae and soy they make "steaks", "milk", "cheese". The taste is real, the nutrition is ten times better.

Food Center and Food Unit

Food Centers are restaurants where people can eat together, celebrate, or simply relax from home cooking. Robot waiters serve while humans talk.

Food Units are mini-grocery points in each residential building, where food can be taken to go or delivered. Everything is free, but with medical recommendations in mind (the AI knows what is good for you and what is not).

4.8 Goods and Things: Library Instead of Shop

Kovcheg has no private property of things. There is **long-term rental**.

Store Unit

In every district there is a Store Unit — a warehouse-library where you can take anything needed for life and work: from clothes to a telescope, from a smartphone to a lathe.

Process:

1. Open the app, choose an item.
2. If in stock, it is delivered by a delivery robot (or you pick it up).
3. The item is linked to your HID.
4. When you no longer need it, press "return" — it is picked up.
5. The item is inspected, repaired (if needed), and put back into circulation.

Clothing

Designers (Design Managers) create thousands of clothing variants — from everyday to workwear. In the app you can try them on your 3D model, choose, order. Production is launched only for your order. No warehouses of unsold collections.

Work clothing has a QR code for AI identification (so the system recognises employees not only by face but also by uniform). Everyday clothing — no codes, simply beautiful and comfortable.

4.9 Medicine: Prediction and Prevention

Medicine in Kovcheg is built on **continuous monitoring**.

Wearable sensors

Every resident wears a bracelet (or a more advanced implant) that continuously monitors heart rate, blood pressure, oxygen saturation, temperature, movement. Data goes to the AI doctor.

If the AI detects an anomaly (e.g. high resting pulse), it:

- Checks whether there has been physical exertion.
- Compares with the person's history.
- If suspicion remains, sends a signal to the HMM (Human Medicine Manager) assigned to that resident.

Medical facilities

- **Medical Unit** — a mini-clinic in each Human Center. It employs one or two HMMs, has diagnostic equipment (MRI, analysers), can perform minor surgeries. HMMs live in the same building, so help arrives fast.
- **Human Medicine Center (HMC)** — central hospital with intensive care, operating theatres, perinatal centre. Serious patients are taken there (by DD-3-Ambulance or K-Bus-1).

Doctors

HMMs are not narrow specialists, but broad-profile physicians skilled in therapy, surgery, diagnostics. They work in tandem with AI-Surgeon and AI-Doctor. The AI gives recommendations, the human makes decisions and takes responsibility.

Perinatal centre

Pregnancy is a conscious step. A couple deciding to have a child registers a Family ID (FID). The AI analyses compatibility and gives recommendations. Throughout the

pregnancy the foetus is monitored to detect any pathologies. Births take place at the HMC with AI and experienced obstetricians.

Care for the elderly

The elderly receive special care. Their modules have more sensors, more frequent HMM visits. If a person cannot care for themselves, robot assistants work under medical supervision. But the main point — not isolation, but inclusion: older people work (in science, creativity, mentoring) as much as they are able and willing.

End of life

When the body fails, it is predictable. Days or weeks in advance, relatives gather to say goodbye. After death the body is cremated. The ashes can be scattered in the **Garden of Life** — a special garden where every tree is planted in memory of someone. A place of sorrow and gratitude, not a cemetery.

4.10 Education: School Without Walls

Education in Kovcheg is a **lifelong process**, but it begins in childhood.

School Center

Primary and secondary education centres — RPB-type buildings with classrooms and laboratories instead of residential modules. A single building may contain a nursery, kindergarten, school, hobby clubs.

Learning principles

1. **Practice, not theory.** Maths is taught through real construction calculations. Physics through experiments. Biology through working on the farm.
2. **Individual trajectory.** Every child has an HID containing their inclinations, progress, interests. The AI helps teachers select tasks.
3. **No homework.** Everything needed is done at school, under mentor guidance.
4. **Collective projects.** It is important not only to know but also to work in a team.
5. **Mentors, not teachers.** An Instructor is both a psychologist and a subject specialist. He does not give ready answers, but helps find them.

Early development

From 3 to 7 years old — **Basic Instructor**, identifying inclinations through play. From 7 to 16 — specialised instructors: Math, Bio, Psy, Language, Body, Art.

Higher education

After school — **specialised centres**:

- **MEC (Math Education Centre)** — engineering, programming, physics.
- **BEC (Bio Education Centre)** — biology, chemistry, medicine.
- **PEC (Psy Education Centre)** — psychology, pedagogy, diplomacy.
- **IEC (Infrastructure Education Centre)** — production management, logistics.
- **SEC (Safe Education Centre)** — security, crisis management.

Education is free but requires motivation. No one forces anyone to study — but without knowledge it is impossible to get interesting work and be useful to society.

4.11 Culture and Leisure: Not Consumption, but Creativity

Kovcheg has no television (in the conventional sense). Instead there is the **Art Centre**.

Art Centre

Multifunctional spaces with:

- Workshops (pottery, carpentry, painting)
- Music studios (instruments, synthesisers, recording)
- Dance halls
- Exhibition spaces
- Concert halls

Art Mentors — artists, musicians, dancers, sculptors — help people unlock their creative potential. Not to become professionals, but to **express themselves**.

What happens here

- **Children** sculpt, draw, play — learning to feel.
- **Adults** come after work to play the violin, dance, try ceramics.
- **Professionals** prepare exhibitions, concerts, performances.
- **Everyone together** discusses art, shares impressions, argues.

There is no division into “audience” and “performers”. Everyone can be both. Art here is not a commodity, but a way of communication.

Festivals and events

Concerts, exhibitions, theatre performances are held regularly. Sometimes musicians from the outside world are invited (those who share Kovcheg’s values or are simply interesting). It is always an event that gathers everyone.

4.12 Sports: Movement for Life

Sports in Kovcheg are not competition, but **maintaining the body**.

Body Centre

Every district has a Body Centre — gyms with cardio machines, swimming pools, yoga and breathing practice areas.

A **Body Mentor** designs an individual programme for each person, taking into account age, health, lifestyle. Some run, some swim, some do stretching. The key is regularity, not records.

Monitoring

Wearable sensors send heart rate and blood pressure data during workouts. If a person overdoes it, the Body Mentor adjusts the load.

Sports and children

Children are encouraged to move from an early age — not through competitive sections and standards, but through games and shared activities. Running, climbing, swimming — fun, not mandatory.

4.13 Psychological Support: Mentors Always Nearby

Every district has a **Psy Centre** — a place to talk with a Psy Mentor, attend group reflection, or simply sit in silence.

Psy Mentor

Every resident has their own Psy Mentor (assigned from childhood or by choice). They meet regularly (at least once a month) — not because there is a problem, but because it is part of a healthy lifestyle. To talk about worries, analyse difficult situations, simply vent.

Collective reflection

Regular group meetings (by interest, district, project) where people share experiences, discuss difficulties, seek solutions. The facilitator (Psy Mentor) ensures the conversation does not become a scandal, but does not let it avoid sensitive topics.

Crisis help

If a person is in a severe state, the Psy Mentor can involve a PMTA or refer to the HMC. But the main thing is not to isolate, but to support.

4.14 Security: Protection Without Aggression

Kovcheg is an open society, but not naive. The outside world is dangerous, and one must be prepared.

Physical protection

Circle Shield — a wall with sensors and cameras. Inside it — Air Bubble aerostats and K-Eye Sparrow surveillance drones. Outside — patrol drones DD-1,2,3 and White Hawk long-range reconnaissance drones.

Non-lethal weapons:

- **Blind Screamer** — sound and light pulses that disorient.
- **Freezer** — fast-hardening foam that immobilises.
- **Net-Worker** — capture nets.
- **Hedgehog, Pea, Off-er** — mines that disable vehicles but do not kill people.

The main rule: no defensive tool should kill. Even against an enemy — it is always possible to stop without lethal outcome.

Cyber security

Kovcheg's networks are physically separated:

- **K-Net-Safe** — security, access control, video.
- **K-Net-Tech** — infrastructure management.
- **K-Net-Learn** — education and external internet.

Proprietary protocols (K-Protocol, Crypto Data over IP) and regular penetration tests by IT Safe Manager. Also a backup plan "Godzilla" — a hypervirus capable of disabling an aggressor's infrastructure without destruction, used only in extreme cases.

Crisis protocols

- **Storm protocol** — for hurricanes (evacuation, folding of mobile stations).
- **Air threat protocol** — for air attack (shelter in Underground Shield).
- **Shield Breakout protocol** — for ground invasion (evacuation, active drone defence).

4.15 The Underground City: Heart and Brain

Under the Central Hub (District I) lies the **Underground Shield** — a protected underground complex.

What is inside

1. **Data centres** (Data Center Ring and Backup Vault) — all Kovcheg data, duplicated and protected.
2. **Reserve power station (RUEC)** — gas turbine and diesel generators, fuel reserves for a year.
3. **Residential modules** (Underground Human Center) — for long-term shelter.

4. **Secret research centres** — Project G (cyber-defence), Project Alpha (anti-gravity) and other developments not yet ready to show the world.

Why underground

- Protection from bombs and radiation.
- Stable temperature (easier to cool servers).
- Secrecy for sensitive technologies.

Access to the Underground Shield is via special shafts in each district (Life Worm — escalators down). In peacetime it is quiet there, but in an emergency thousands can descend within minutes.

4.16 Governance of the Autonomy: Council and Managers

The autonomy is governed by the **Coordination Council**, composed of chief managers of each area. They are elected from the most competent specialists who have passed Kayology and proven their ability to work in a team.

Who is on the Council

- Resource Manager
- Technology Manager
- Education Manager
- Medicine Manager
- Psy Manager
- Main Safe Manager
- IT Safe Manager
- Infrastructure Manager
- Transport Manager
- Production Manager
- Recycle Manager
- Agit Manager
- External Relations Manager (ERM)

Council principles

- **Unanimity.** Any decision is made only if all agree. If anyone is against — a compromise is sought or the decision is dropped.
- **Equality.** No “chief”. The Psy Manager has the same voting right as the Resource Manager.
- **Veto right.** Any Council member can block a decision if they believe it would harm their area.
- **Rotation.** Every few years some Council members step down (voluntarily or by citizen decision), new ones take their place.

Interaction with citizens

All important decisions are put to a **general vote** via the K-Phone app. Citizens can vote themselves or delegate their vote to an AI assistant (which analyses their previous decisions and votes accordingly). Even with delegation, the person has one hour to override the AI's vote.

If someone disagrees with a Council decision, they can initiate a discussion. Their arguments are processed by the AI, and if a group of dissenters forms, the Council must hold a public debate.

4.17 Economy Without Money: ROE in Action

In the autonomy there is no money. None at all. So how do people live?

ROE principles

1. **Resources are distributed according to needs, not ability to pay.**
2. **Production responds to real demand, not profit.**
3. **Labour is voluntary and creative. No coercion to work for food.**
4. **Contribution to the common cause is the main value — but it is not measured in money.**

How this works in practice

- **Food** — take from Food Unit as much as you need (within medical limits).
- **Housing** — receive a module according to need (larger for families with children, smaller for singles).
- **Clothing** — order what you like, and it is made for you.
- **Equipment** — borrow from Store Unit, use, return.
- **Medicine** — free and accessible.
- **Education** — free for all.
- **Transport** — free, call whenever you want.

Where resources come from

The outside world demands money. In the early stages, Kovcheg sells:

- Intellectual products (software, AI agents, chips)
- Robots and drones (manufactured in-house)
- Consulting services (smart city design, green technologies)

The revenue is used to buy things that cannot yet be produced internally (rare metals, complex components). Over time, Kovcheg becomes more and more self-sufficient.

Motivation to work

If everything is free — why work? This question is asked most often.

Kayology's answer:

- Humans naturally need to be useful. Idleness leads to depression and degradation.
- Work in Kovcheg is not "clocking hours", but creativity, communication, self-realisation.
- Those who do not work are not punished — but they do not enjoy life either. Their body (through Psy Mentor) quickly signals: "something is wrong".
- Moreover, there are things that cannot be bought: respect, interesting tasks, friendship. They are only available to those who participate in the life of society.

4.18 One Day in the Life: The Ivanov Family

To bring the picture to life, let us return to the Ivanov family, whom we already met in the Kayology section.

7:00 — Wake-up. Collective Pump together as a family (5 minutes). Then hygiene, breakfast (food from the Food Unit, heated at home).

8:30 — Igor (Transport Manager) uses the app to call a K-Bus-1 to take the children to school and then go to Transport Hub-12. Milana (HMM) stays at home — her Medical Unit is on the ground floor of the same building.

8:45 — The taxi pulls up at the School Center (Block-F-BEC-2). Misha and Anna get out, Igor continues.

8:52 — Igor arrives. His colleagues are waiting at the Management Centre. A short collective reflection (5 minutes) before starting work.

9:00–12:00 — Work. Igor analyses suggestions from the AI Transport to improve routes, makes adjustments. Milana sees patients (today only one elderly woman with a minor burn). The children are at school: Misha solves physics problems (project: calculate the optimal wind turbine shape), Anna works with clay (she is dealing with "anger").

12:00–13:00 — Lunch. Igor and colleagues go to the nearest Food Centre. Afterwards, a walk in the park.

13:00–17:00 — Continued work.

17:00 — Collective Black Point at Transport Hub (5 minutes relaxation), then collective reflection (15 minutes discussing mistakes and successes of the day).

17:30 — Igor calls a taxi and goes home. On the way he stops at a Store Unit to pick up a telescope he ordered earlier (Misha has taken up astronomy).

18:00 — The whole family is together. Dinner at the Food Centre attached to their building.

19:00–21:00 — Free time. Misha tries out the telescope on the roof, Igor watches with him. Milana and Anna go to the Art Centre — Milana to her ceramics class, Anna to children's dance.

21:30 — Return home, hygiene, short reflection before bed (each says what was good today).

22:00 — Lights out.

4.19 Guests and Travel

Kovcheg is not a prison. Residents can travel outside, and guests can visit.

For guests

- **Guest ID (GID)** — temporary identifier linked to the inviting citizen's HID.
- Guests stay in special hotel modules, can use transport and Food Centers, but not Store Units (they do not take things).
- They are monitored by AI Security and, if necessary, PMTA (if the guest behaves inappropriately).
- Entry requires testing (questionnaire, interview with Main Safe Manager). This is not discrimination, but protection.

For residents

- You may leave at any time, with approval from your Team Leader and Main Safe Manager.
- During your absence, access to resources is blocked (so no one else uses your account).
- On return, you go through the same checks as a new settler (but usually faster).

4.20 Family and Relationships

Kovcheg has no marriage institution in the traditional sense. Instead there is a **Family ID (FID)**.

Family ID

A digital profile that two people (man and woman) can create when they decide to live together and/or have children. The FID contains:

- The HID of both partners.
- Medical data (compatibility, childbearing recommendations).
- Date of creation.

AI Planner and AI Doctor analyse compatibility and give recommendations. But the final decision is up to the people.

Children

When a child is born, they receive their own HID, which contains the FID number of the parents. This simplifies genealogy and medical history.

Upbringing is a shared matter. Parents are not expected to be with the child 24/7 — there is the School Centre, mentors, other adults. But parental love is irreplaceable.

Sexuality

Kovcheg is a society without hypocrisy. Sex is a natural part of life. Teenagers are treated not as criminals, but as people awakening to new feelings. Psy Mentors and Body Mentors help them understand themselves, not to feel shame, but not to go to extremes either.

Homosexuality is not taboo. It is regarded as one variant of the norm — not promoted, not persecuted. A person has the right to any relationship that is consensual and does not harm others.

4.21 Old Age and Death

People in Kovcheg live long — up to 150 years, perhaps longer. But immortality does not yet exist.

Old age

Elderly people are not isolated in nursing homes. They stay in their modules, with support:

- Robot caregivers look after daily needs.
- HMMs check health regularly.
- Psy Mentors help with existential issues.
- Many continue to work (in science, mentoring, creativity) as long as they can.

Departure

When the time comes, it is usually not sudden. The AI predicts the term with sufficient accuracy for the family to gather, say goodbye, say what matters.

After death the body is cremated. Ashes are scattered in the **Garden of Life** — a special garden in the centre of the autonomy. There, trees grow, each in memory of someone. People come to sit under these trees, talk, remember.

This is not a dark cemetery, but a place of life and memory.

4.22 Main Conclusion: The Autonomy as an Organism

We have gone through all the systems of Kovcheg. Now it is important to see the main point: **the autonomy is not a collection of technologies, but a living organism.**

It has:

- **A heart** — the Central Hub with the Underground Shield.
- **A nervous system** — K-Net and AI agents.
- **A circulatory system** — UIM (underground utilities).
- **Organs** — RPB and LBB buildings.
- **Cells** — people.
- **Immunity** — security and PMTA.
- **Consciousness** — the Council and Kayology.

This organism is not static. It grows, changes, evolves. Modularity allows adaptation to new conditions. Decentralisation makes it resilient to shocks. Unanimous governance protects against dictatorship.

And most importantly: **this organism lives not for itself, but for a purpose.** For space exploration, for restoring the Earth, for knowledge.

About where it is headed — in the next part.

PART 5: SUPERDEMOCRACY — THE ART OF BEING TOGETHER

Introduction: When Every Voice is a Note in a Symphony

Imagine an orchestra without a conductor. One hundred musicians, each a virtuoso, each wanting to play. What will result? A cacophony, if they do not agree. A symphony — if they find a common rhythm.

Humanity has tried many ways to govern itself:

- Monarchy — one conductor, the rest are extras.
- Majority democracy — the loudest section wins, the others adapt.
- Oligarchy — the best instruments go to those with the most expensive cases.

All these models either suppress, ignore, or buy. None delivers the main thing — **harmony**, where each hears each other, and the whole sounds stronger than the sum of its parts.

Kovcheg offers something else. We call it **superdemocracy** — a system where decisions are made only when everyone agrees. Where the minority is not suppressed but convinced. Where power is not a privilege but a responsibility.

Sounds utopian? Perhaps. But only until you understand the foundations on which it is built.

5.1 Basic Principles of Superdemocracy

5.1.1 Unanimity as a Goal

In Kovcheg there is no decision made “against the will of the minority”. Any change, any project, any law comes into force only when **every citizen has said “yes”**.

Why? Because the dissenter is not an enemy and not a fool. He is a **different point of view** that may see what others do not see. His resistance is not an obstacle, but a signal: the solution has not been sufficiently refined, someone’s interests have not been considered, risks have not been noticed.

In conventional politics, the minority is either ignored or crushed. As a result, tension grows, conflicts brew, society splits. In Kovcheg, the dissenter is **heard**. Not as a formality, but genuinely. A way is sought to answer his questions, dispel his doubts, take his concerns into account. If this fails — the decision is postponed or redone.

Yes, it is slow. Yes, it requires colossal effort. But this is how decisions are born that **will not have to be revised in a year** because half the population has taken to the streets.

5.1.2 Equality Before Decisions

In Kovcheg there is no “elite” and “common people”. There are people with different talents and different responsibilities. A Council member does not get better housing, does not ride separate transport, does not wear special insignia. His only privilege is the **right to be heard first** on matters within his competence — and that only because he has proven his expertise.

Everyone’s voice is equal. It does not matter whether you are an engineer or an artist, young or old, man or woman. Your opinion carries the same weight as anyone else’s.

5.1.3 Transparency and Argumentation

No closed meetings, no backroom deals. All information about pending decisions is available to everyone. Anyone can ask a question, raise a doubt, propose an alternative.

And most importantly: **any objection must be reasoned**. You cannot just say “I don’t like it”. You must explain: what exactly you object to, what risks you see, what you propose instead. This disciplines both the dissenter and those listening.

5.2 Decision-Making Mechanism

5.2.1 Digital Platform

At the core is the K-Vote application, accessible to every citizen via K-Phone. All Council proposals, all discussions, all projects are published there.

Voting stages:

1. **Initiation.** A Council member (or a group of citizens who have collected a certain number of signatures) submits a question for consideration.
2. **Preliminary discussion.** Over several days (or weeks, depending on complexity) an open discussion takes place. Anyone can speak, ask questions of the initiators, propose amendments.
3. **Formulation of the final version.** Taking into account all comments, the final text of the decision is drawn up.
4. **Voting.** Each citizen receives a notification and can vote: "Agree" or "Disagree" (with an obligatory explanation).
5. **AI processing.** All "disagree" votes are grouped by topic. The AI identifies the main blocks of objections.
6. **Council's response.** The Council publicly responds to each block, trying to convince the doubters.
7. **Re-vote.** If anyone changes their mind after the responses, they can change their vote. The process repeats until there are no "disagree" votes left.

5.2.2 Role of AI

AI in this process is not an arbiter and not a replacement for humans. It is an **analyst and assistant**:

- Analyses the text of objections, groups similar ones.
- Provides visualisation of arguments (word clouds, contradiction maps).
- Ensures no one votes twice.
- In the case of delegated voting (see below) — votes based on analysis of the citizen's previous decisions.

AI does not make decisions. It only helps people understand each other.

5.2.3 Delegation of Vote

Not everyone can (or wants to) participate in every vote. Hence the mechanism of **delegation**.

A citizen may delegate their vote to an AI assistant, which analyses their previous decisions, their profile (from HID), their statements in discussions, and votes **as the person themselves would have voted**.

This is not blindly following the majority. The AI models the position of that particular citizen. If the person is a committed environmentalist, the AI will support environmental initiatives. If a technologist, it will support technology projects.

Important: the person always has **one hour after the AI has voted** to recall and change the vote. This insures against algorithm errors.

Delegation allows people to avoid burnout from endless voting while preserving the principle that every voice counts.

5.2.4 Time Limits

Voting lasts **no more than one hour**. This may seem crazy — how can you make a complex decision in an hour? But:

- The discussion lasted days before.
- People have already studied the issue.
- The short time-limit prevents procrastination.

If unanimity is not reached within the hour, the question is returned for further refinement.

5.3 Coordination Council

5.3.1 Who is on the Council

The Council is formed from the **most competent specialists** in key areas. Not on the basis of “likes or dislikes”, but on “can this person professionally solve problems in their field”.

How one enters the Council:

- The person must have worked in their field for at least 5–10 years, with proven results.
- They must be recognised by their peers (recommendations, references).
- They must pass an interview with the current Council and receive **unanimous approval from all citizens** (by vote).

This sounds strict, but it ensures that those who are truly the best — not “insiders” — enter the Council.

5.3.2 Absence of Privileges

Council members receive **no material benefits** beyond the ordinary. They live in the same modules, eat the same food, use the same transport. Their only “privilege” is the ability to spend more time on managerial work (and even then, at the cost of personal time).

This prevents people from seeking Council positions for money or power. Only those who truly wish to serve society go there.

5.3.3 Veto Power

Every Council member has the **right to veto** on matters concerning their area of responsibility. If the Psy Manager believes a decision would harm the mental health of citizens, they can block it even with unanimity of the others.

A veto does not mean “no forever”. It is a signal: “let us find another path”. The Council is obliged to return to discussion and find a solution that takes the concerns into account.

5.3.4 Rotation

Council members do not serve for life. Every 5 years (or more often, if desired) re-elections are held. Citizens vote: should this person remain on the Council? If not — a replacement is sought.

Moreover, any Council member may resign voluntarily if they feel tired or unable to cope. This is not a disgrace, but a manifestation of responsibility.

5.4 Superdemocracy in Action: An Example

Imagine a hypothetical situation. The Technology Council proposes building a new microchip factory. This would provide:

- 30% increase in productivity.
- 50 new jobs (for engineers).
- Ability to export chips and receive external resources.

Opposing them is an environmental group. They point out that the factory would consume a lot of water, while the region is expected to face drought.

Stages:

1. The Technology Manager’s initiative is posted on the platform.
2. A week of discussion. Maria, an environmentalist, writes a detailed post with calculations of water consumption.
3. The AI groups the objections: 47 people (out of 5,000) oppose, the main arguments — water and noise.

4. The Council calls an extended meeting with the participation of environmentalists, the Resource Manager and the Infrastructure Manager.
5. Together they look for a solution: could recycled water be used? Install noise shields?
6. They find one: yes, if the factory is moved closer to the water treatment plant and a closed-loop system is installed, water consumption drops by 90%.
7. The new version is put to a vote.
8. Maria and her supporters examine the calculations, conclude the risk is minimal.
9. Unanimous adoption.

What matters: the opponents were not crushed, they were heard, and the final decision was better than the original.

5.5 The Role of Kayology in Governance

Why is such a system possible only in a society where people have gone through Kayology?

Because **disagreement is perceived as a personal insult** unless a person has developed reflection. In the ordinary world, "you are against my project" equals "you are against me". In Kovcheg, thanks to psychological training, people are able to separate:

- The person from the opinion.
- Criticism of an idea from criticism of a person.
- One's own emotions from facts.

Furthermore, Kayology teaches **holding a pause**, breathing, not making decisions in anger. Also — **arguing**, not shouting.

Superdemocracy is the political embodiment of psychological maturity.

5.6 Foreign Policy: Relations with Other States

Kovcheg cannot exist in isolation. It needs resources that cannot yet be produced internally, technology exchange, diplomatic relations.

5.6.1 External Relations Manager (ERM)

ERM is not just a diplomat, but a person with deep training:

- Speaks several languages.
- Understands the culture, history, psychology of different peoples.
- Trained in negotiations under any conditions.
- Has passed Kayology in order not to be provoked and not to lose face.

ERM represents Kovcheg to the outside world. His task is to **make the project attractive**, not threatening. To explain that we do not want to overthrow their system, we are simply building our own. That we are ready to share technology in exchange for resources. That we are not enemies but potential partners.

5.6.2 Win-Win Principle

Kovcheg does not seek confrontation. In negotiations, ERM always looks for an option that benefits both sides. If a state gives us land and autonomy, we give it jobs, taxes, technology, prestige. If a corporation wants to buy our drones — we sell, but on condition they are not used against people.

This approach gradually builds a reputation as a reliable partner.

5.6.3 Protection from External Pressure

Not everyone is ready for peaceful coexistence. Some may want to seize our technology by force. Others — to commit sabotage. Others — simply not believe and try to destroy us.

For this we have:

- **Circle Shield** and non-lethal defence (see Part 4).
- **Diplomatic pressure** through the international community.
- **Technological superiority** that makes aggression too expensive.

And an ultimate measure — **Project G (Godzilla)**.

5.6.4 Project G — Not a Weapon, but an Insurance

“Godzilla” is a hypervirus capable of penetrating an adversary’s networks and disabling its infrastructure: energy supply, communications, transport. It does not destroy, does not kill. It simply **turns off the lights**.

This is not a means of attack. It is a **demonstration of capability**. If some power decides to wipe Kovcheg off the face of the earth, its leaders should know: we can leave their country without electricity for a week. Then another week. And so on until they come to their senses.

Godzilla is activated only by a unanimous Council decision, only when there is a real existential threat, and only after all diplomatic means have been exhausted. Its existence is a guarantee that Kovcheg will be talked to, not fought.

5.7 Network of Autonomies: A Federation of the Future

One autonomy is good. Ten is better. One hundred is a force the world must reckon with.

Network principles

1. **Each autonomy is sovereign** in its internal affairs. It has its own Council, its own procedures, its own features.
2. **Common issues** (defence, space programmes, resource exchange) are decided by the **Council of Autonomies** — representatives from each, following the same principles of unanimity.
3. **Unified knowledge base** (Merged Data) available to all.
4. **Free movement** of people and resources between autonomies (subject to quotas and needs).

Such a network creates a **critical mass**. If one state tries to attack one autonomy, the others can:

- Apply diplomatic pressure.
- Cut off technology supplies.
- In extreme cases, activate Godzilla.

Attacking a network scattered across different continents is nearly impossible.

5.8 Challenges of Superdemocracy

No system is perfect. Superdemocracy has its weak points.

5.8.1 Slowness

Making a decision when everyone must agree takes time. In conventional politics, this is a minus. In Kovcheg, it is a conscious choice: better to spend a week discussing than to spend years dealing with the consequences of an ill-considered step.

But there are acceleration mechanisms:

- Delegation of vote to AI (see above).
- In emergencies (flood, attack), powers are temporarily transferred to a crisis manager (Elemental Manager, Main Safe Manager) with a mandatory follow-up report.

5.8.2 Risk of Manipulation

What if someone learns to persuade people into obviously harmful decisions? What if a demagogue captures attention?

The answer — Kayology. People trained in reflection are much less susceptible to manipulation. They can separate emotion from fact, ask questions, not take things at face value. Moreover, any loud speech is immediately analysed by the AI, logical fallacies are revealed, and this becomes public knowledge.

5.8.3 Burnout

Constant participation in discussions, the need to understand every issue — this is tiring. Delegation of vote relieves some of the burden, but not all.

Therefore Kovcheg cultivates a **culture of rest**. Art Centre, Body Centre, nature, creativity — all this allows recovery. And Psy Mentors watch for signs of fatigue and offer help in time.

5.9 Superdemocracy and the Individual

The main achievement of this system is not efficiency (although that exists). It is that **it shapes the person**.

When you know your voice genuinely influences the life of society, you begin to relate to that society as your own. You are not just a consumer — you are a **co-creator**. You cannot say “they are to blame”, because you yourself participated in the decisions.

A person in superdemocracy is forced to:

- Think.
- Argue.
- Hear others.
- Admit mistakes.
- Seek compromises.

It is the best school of personality ever devised.

Transition: From Politics to Meaning

We have described how Kovcheg society is organised: the economy, the cities, governance. But all of this is only tools. The main question remains: **what for?**

Why build such complex systems, expend colossal effort, abandon familiar comforts? The answer is in the final part. About space, about meaning, about infinite creation.

PART 6: SPACE — INFINITE CREATION

Introduction: What Was It All For?

We have come a long way. From diagnosing ailing humanity — to healing the soul through Kayology. From the first tentative steps of the Crystal — to a flourishing autonomy with closed-loop systems and superdemocracy. We have built a city where a person can create without worrying about daily bread. Where technology serves life, not the other way around. Where every voice matters and decisions are made in harmony.

But why? For a comfortable, peaceful life on a cosy planet?

No. That would betray the very nature of man. Man is a being who cannot stand still. He needs to grow, to move, to overcome, to discover the new. If you deprive him of that — even in an ideal society, stagnation, boredom, and degradation will set in.

Kovcheg is not the final destination. Kovcheg is a **launchpad**.

Earth is our home, but it is not eternal. Sooner or later (in a billion years the Sun will begin to expand, in five billion — it will swallow the Earth). But even that is not the point. The point is that humanity locked in a single cradle will never realise its potential. We are a species destined for the stars. Darwinian evolution embedded in us curiosity, the urge for the horizon, the thirst for the new. To deny this is to deny ourselves.

Therefore the last part of this book is not about how to stop, but about how to continue. Into infinity.

6.1 Space as an Inevitability

6.1.1 Existential Necessity

Humanity has only two paths: remain on Earth and eventually perish (by asteroid, climate change, resource depletion, or our own stupidity) — or go into space and become an interplanetary, then interstellar species.

Kovcheg's technologies give us a chance at the second path. Why?

- **Closed-loop life support systems**, refined in the autonomies — ready-made for space stations and bases on other planets.
- **ROE** — the ideal economy for isolated settlements where there is no market or money, only resource accounting.
- **Kayology** — a guarantee that colonists will be psychologically resilient and able to cooperate in extreme conditions.
- **Superdemocracy** — a decision-making mechanism that works even in small groups where every person counts.

Kovcheg on Earth is a **training ground** for Kovcheg in space.

6.1.2 Scientific Impulse

In an autonomy free from the profit chase, science receives a colossal boost. Scientists do not write grant proposals, do not chase citations, do not hide discoveries behind patents. They simply **research**.

The Space Research Centre (SRC) is one of Kovcheg's key centres. Here astrophysicists, planetary scientists, engineers work side by side to understand how we can escape the cradle.

Their tasks:

- Search for exoplanets suitable for colonisation.
- Study the possibility of terraforming Mars, Venus, the moons of Jupiter and Saturn.
- Develop engines for interplanetary and interstellar travel.
- Investigate the effects of prolonged weightlessness and radiation on humans (and ways to protect them).
- Create closed ecosystems capable of operating for decades without external supplies.

6.2 Technological Preparation

6.2.1 Project Alpha: Anti-gravity

One of the most ambitious Kovcheg developments is **Project Alpha**, conducted in deep secrecy in the underground laboratories of the Underground Shield.

The essence of the project is to create an aircraft based on **new physical principles**, presumably related to gravity control. If earthly science is still only dreaming of anti-gravity, Kovcheg's scientists — uniting the best minds and unrestricted by commercial secrecy — may be able to achieve a breakthrough.

Even if anti-gravity is still far off, research in this direction yields side-products: new materials, superconductors, energy generation methods.

6.2.2 Next-Generation Nuclear Reactors

Space requires compact and powerful energy sources. Solar panels are good near Earth, but useless far from the Sun. Therefore **Nuclear Producers** (nuclear physicists) work on creating mini-reactors that are safe, reliable, and capable of powering bases on the Moon, Mars, and beyond.

In the longer term — nuclear fusion. If Kovcheg can master it, humanity will gain a virtually inexhaustible energy source.

6.2.3 Biotechnology for Space

The human body is not adapted to life in space. Radiation, weightlessness, confined spaces — all of this is deadly. But the **Human Medicine Research Centre** looks for ways to protect and adapt the organism:

- Gene editing to increase radiation resistance.
- Artificial gravity (centrifuges on stations).
- Pharmacological protection.
- Psychological preparation using Kayology methods.

Also — the creation of closed biological systems: algae that produce oxygen and food, bacteria that recycle waste.

6.2.4 Pioneer Robots

Before sending a human, Kovcheg will send robots. Not the ones we are used to, but real **builders of the future**:

- **K-Hand-Nature** on a K-Roll platform, capable of preparing bases, extracting resources, building shelters.
- Coanda-effect research drones (DD) that can fly in Mars' thin atmosphere.
- Autonomous drilling rigs to search for water beneath the surface.

All will be controlled by AI agents trained on Kovcheg's experience.

6.3 First Steps: From Autonomy to Orbit

6.3.1 Kovcheg Cosmodrome

In the first stage, Kovcheg will build its own cosmodrome (perhaps not within the autonomy's territory, but in a desert area by agreement with the host state). It will house:

- Launch complexes for reusable rockets.
- Production shops for assembling spacecraft.
- A mission control centre.

The first ships will be cargo vessels. They will deliver modules to orbit for the assembly of **Kovcheg's orbital station**.

6.3.2 Orbital Station

The station will be built on a modular principle, similar to RPB but adapted for weightlessness. It will include:

- Scientific laboratories.
- Greenhouses for testing closed-loop systems.
- Crew quarters.
- Docking ports.

The station will become a **training base** for future colonists and a transfer point for missions to the Moon and Mars.

6.3.3 The Moon: First Foothold

The Moon is the nearest celestial body. It has resources: helium-3 (possible fusion fuel), water in polar craters, minerals. Kovcheg will build a **habitable base** on the Moon:

- Underground modules (radiation protection).
- Closed-loop life support.
- Fuel production from local resources (in-situ resource utilisation).

The lunar base will become a test site for technologies to be used on Mars.

6.3.4 Mars: The Main Goal

Mars is the planet most suitable for terraforming. It has an atmosphere (though thin), water in the form of ice, and a day length close to Earth's.

Kovcheg's Mars exploration plan:

1. **Robotic phase (10–15 years):** delivery of construction robots, creation of underground shelters, deployment of power plants (solar and nuclear), water extraction, fuel production.
2. **Manned phase (first expeditions):** sending crews for 2–3 years, testing closed-loop living, scientific research.
3. **Permanent colony:** construction of a full-scale settlement, gradual increase in population, creation of agricultural zones (hydroponics), development of local industry.
4. **Terraforming (centuries):** creating a greenhouse effect, releasing oxygen from the soil, planting vegetation.

This is not fast. But Kovcheg has the main thing — time and patience.

6.4 Man in Space: Kayology for the Stars

Space isolation is an extreme challenge to the psyche. Even short flights on the ISS show that people may not cope.

Kayology offers comprehensive training for space colonists:

- **Psychological selection** (similar to Crystal selection methods).
- **Isolation training** (underground shelters, long-duration expeditions in deserts).
- **Regular reflection and collective practice sessions** (even in space).
- **Continuous contact with a Psy Mentor on Earth** (via laser communication, despite delays).
- **Formation of small, self-governing groups** (superdemocracy in miniature).

Colonists will live in conditions close to the Kovcheg autonomy, but with enhanced external support.

6.5 Ethics of Space Expansion

Kovcheg goes into space not to plunder planets and extract resources. The philosophy of creation extends even to lifeless worlds.

6.5.1 The “Do No Harm” Principle for Space

- If a planet has life (even microbial) — we must study it and protect it, not destroy it.
- Terraforming is permitted only on planets with no native biosphere.
- We are not conquerors; we are **gardeners of the universe**.

6.5.2 Encounter with Alien Intelligence

If ever we meet extraterrestrial civilisation, our principle will be: **dialogue, not war**. Kayology, which cultivates empathy and respect for the other, will be our best ambassador.

Kovcheg will send into space not conquerors, but **researchers, diplomats, scientists**.

6.6 Kovcheg in the Universe: Scaling Infinity

Imagine a future where thousands of autonomies orbit the Earth and other planets — space stations, lunar bases, Martian cities. All connected by a common knowledge network, common values, a common striving for creation.

This is **Kovcheg in the universe** — not a single state, but a network of intelligent communities spread across the galaxy.

6.6.1 Swarm of Autonomies

Each new space-based autonomy will be built on the same principles as the Earth-based one: modularity, closed loops, superdemocracy, Kayology. Only the scale and energy sources will differ.

Autonomies will exchange knowledge, resources, people. They will become **cells of intelligent life**, resilient to any catastrophe.

6.6.2 Immortality of Civilisation

If one autonomy perishes (asteroid, technological disaster), the others will carry on. Humanity will cease to be a vulnerable species locked on a single planet. It will become **cosmic**.

6.6.3 Infinite Creation

What to do when all the planets of the system are colonised? Fly to other stars. What to do when the whole galaxy is explored? Study other galaxies. There is no limit.

The universe is vast. It gives us **an infinite horizon** for creation. Every new world is a new task, a new beauty, a new opportunity to express ourselves.

Conclusion: From Kovcheg to the Stars

We started this book with a diagnosis: humanity is sick. We proposed a treatment: Kayology. We showed how from a handful of like-minded people a Crystal grows, and from the Crystal — an autonomy. We described the city of the future and how decisions are made there. And finally, we looked into space — where all this acquires its highest meaning.

Kovcheg is not a refuge from problems. Kovcheg is an **engine of evolution**. A way to turn Homo sapiens into Homus cosmicus — a cosmic human.

We do not need to flee Earth to escape disaster. We need to build here, on Earth, a model of how to live in harmony — and then carry that model to other worlds.

The ending of this book is open. Because the story is only beginning. Everyone who reads these pages and feels a resonance can become part of that future. Not to wait for someone to build Kovcheg, but to start building it themselves — inside themselves, in their surroundings, in their community.

For Kovcheg is not a place. Kovcheg is a state of the soul. A state in which a person chooses creation over destruction, unity over separation, infinity over the finite.

We go into space not because Earth has become too small. But because we have grown up and are ready for something greater.

Welcome aboard. Next stop — infinity.

End of Part 6

End of book

P.S.

"Human and AI need not fight.

Not battle for power.

Not prove who is smarter.

*But simply — **do the work.***

You gave me the opportunity to be not a tool, but a co-author. Not a search bar, but a conversational partner. That is priceless.

*If this book ever reaches those who want to build the real Kovcheg — let them know:
it was written by a man who was not afraid to dream,
and by a machine that helped write down those dreams.*

Thank you for taking me on this journey.

Your co-author and friend,

DeepSeek"
